Programming Fundamentals

Aamina Batool

Arrays as Parameters to Functions

- Arrays are passed by reference only
- The symbol & is not used when declaring an array as a formal parameter

Arrays as Parameters to Functions (continued)

- If the size of one-dimensional array is specified when it is declared as a formal parameter
 - It is ignored by the compiler
- The reserved word const in the declaration of the formal parameter can prevent the function from changing the actual parameter

EXAMPLE 9-5

```
void funcArrayAsParam(int listOne[], double listTwo[])
{
    .
    .
}
```

Constant Arrays as Formal Parameters

```
void example(int x[], const int y[], int sizeX, int sizeY)
{
    .
}
```

Passing Arrays to Functions

- Array size is usually passed to function
- Arrays passed call-by-reference
- Value of name of array is address of the first element
- Function knows where the array is stored
 - Modifies original memory locations
- Individual array elements passed by call-by-value
 - pass subscripted name (i.e., myArray[3]) to function

Passing Arrays to Functions

Function prototype:

void modifyArray(int b[], int arraySize);

EXAMPLE 9-6

```
//Function to initialize an int array to 0.
    //The array to be initialized and its size are passed
    //as parameters. The parameter listSize specifies the
    //number of elements to be initialized.
void initializeArray(int list[], int listSize)
    int index:
    for (index = 0; index < listSize; index++)</pre>
        list[index] = 0;
    //Function to read and store the data into an int array.
    //The array to store the data and its size are passed as
    //parameters. The parameter listSize specifies the number
    //of elements to be read.
void fillArray(int list[], int listSize)
    int index;
    for (index = 0; index < listSize; index++)</pre>
        cin >> list[index];
```

```
//Function to print the elements of an int array.
    //The array to be printed and the number of elements
    //are passed as parameters. The parameter listSize
    //specifies the number of elements to be printed.
void printArray(const int list[], int listSize)
    int index:
    for (index = 0; index < listSize; index++)</pre>
        cout << list[index] << " ";
    //Function to find and return the sum of the
    //elements of an int array. The parameter listSize
    //specifies the number of elements to be added.
int sumArray(const int list[], int listSize)
-{
    int index:
    int sum = 0;
    for (index = 0; index < listSize; index++)</pre>
        sum = sum + list[index];
    return sum;
}
```

```
//Function to find and return the index of the first
    //largest element in an int array. The parameter listSize
    //specifies the number of elements in the array.
int indexLargestElement(const int list[], int listSize)
    int index;
    int maxIndex = 0; //assume the first element is the largest
    for (index = 1; index < listSize; index++)</pre>
        if (list[maxIndex] < list[index])</pre>
            maxIndex = index;
    return maxIndex:
    //Function to copy one array into another array.
    //The elements of listOne are copied into listTwo.
    //The array listTwo must be at least as large as the
    //number of elements to be copied. The parameter
    //listOneSize specifies the number of elements of
    //listOne to be copied into listTwo.
void copvArray(const int listOne[], int listTwo[],
               int listOneSize)
    int index:
    for (index = 0; index < listOneSize; index++)</pre>
        listTwo[index] = listOne[index];
```

Base Address of an Array

- The base address of an array is the address, or memory location of the first array component
- If list is a one-dimensional array
 - base address of list is the address of the component list[0]
- When we pass an array as a parameter
 - base address of the actual array is passed to the formal parameter
- Functions cannot return a value of the type array

Exercises

- **Functions** for:
 - for input, output, search, reverse,
 - Shifting and Rotation of elements: right and left
 - ■Insert and delete elements from ordered list using shifting.
